What is Knit Visualizer?

Knit Visualizer was created to make it easy for you, the knitter/designer, to create charts from a stitch pattern and modify those charts easily. Why charts? Charts give you a chance to understand how a stitch pattern looks, what two repeats side by side look like before you ever sit down with needles and yarn. Want to change where you start knitting the pattern? That is much easier to do when you can see which stitches line up on top of each other in a chart and how the repeats interact with each other.

Knit Visualizer contains an extensive palette of knitting stitches that you can easily paint onto your chart. From lace, complex cables and color work*, you can do it all easily. The symbols are clear and easy to read. You can easily zoom in/out to determine the best viewing size for your particular chart.

The Knit Visualizer parser will interpret a stitch pattern and build the chart for you. This gives you an excellent starting point for combining different patterns, changing the edge stitch/pattern or whatever you need to do to make the pattern work for your project.

Printing is a snap with multiple layout options for the chart, auto-generated legend, notes and more. A Print Preview screen shows exactly how your chart will look on paper. Printouts can be scaled down to fit more on a page, or scaled up to make the chart easier to read. A large notes area for each chart will let you put special instructions, even a full pattern with your chart. Chart, title, author, notes, and Chart Properties (including font size, row number preferences) are saved in your save file.

For the creative person - Knit Visualizer can also be used to chart out weaving treadle sequences, cross stitch charts, any type of pattern that requires a grid to organize the symbols.

If you are new to knitting using charts, be sure to check out the tutorial available from The Knit Foundry website <http://www.knitfoundry.com/freestuff.html>

How to Read this Manual

The manual covers installation, use of the software and a lot of tips and tricks. Throughout the document you might see these items:

This will be in front of a tip that will help you navigate a window or dialog using keyboard shortcuts.

Information about the application

Text displayed like this is meant to be typed into the Pattern Entry text field.

This icon means a difference in the application for Mac users

Please read through this manual before using Knit Visualizer. Many of your questions will be answered here. For Frequently Asked Questions (FAQs) and other related items, please see <http://www.knitfoundry.com/software.html>

* All charts are black and white. Charts for color knitting are created using different black and white symbols for each color. Future versions of Knit Visualizer will most allow you to use color.

Installation

Knit Visualizer is available on two platforms: Windows & Mac OS X. Instructions for installation on your specific platform can be found here. The instructions for installing the Demo and the full application are the same. You can install the full application on top of the Demo; it will replace the necessary files to enable all features.

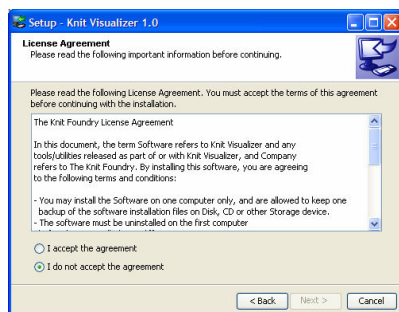

Windows XP: Download and CD

System Requirements:

Disk Space	approx 65MB
Memory	512MB or more recommended
Screen Resolution	1024x768*

Older processors (more than a few years old) might have difficulty running Knit Visualizer due to the graphics-intensive nature of the application. More memory is always recommended and will improve the performance of Knit Visualizer accordingly. A dedicated video card isn't required; but even one that has 64MB of memory will improve your system's performance while running Knit Visualizer.

Once you have the installation exe file (either via download, or on a CD), browse to the file and double click it to begin the installation. Below you will find the important screens in the installation process, with an explanation of their purpose. If you received Knit Visualizer on CD, the CD should auto-play the installation program for you when you insert it into your CD drive on your computer. If not, browse to the CD, and open the Windows directory. Double click the exe file to begin the installation.

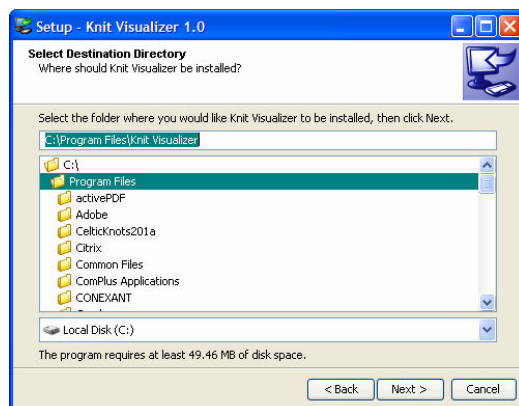

License agreement

You must agree to the license in order to install Knit Visualizer. Selecting "I accept the agreement" will enable the Next button.

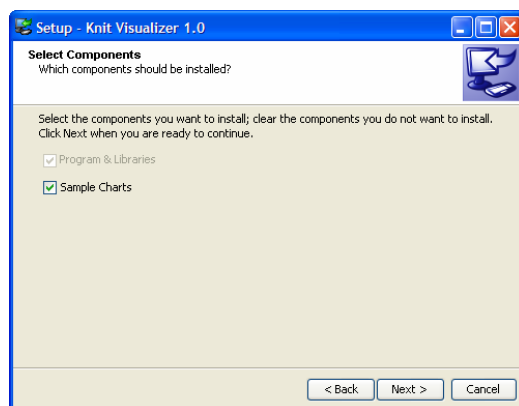

* The current version of Knit Visualizer is set to startup at 1024x768 resolution. To force it into 800x600 follow these steps:

- Run Knit Visualizer
- Right click on the task bar and select Task Manager OR you can use Control-Alt-Delete to get to it
- Make sure the Applications tab is selected
- Find the Knit Visualizer entry, and right click on it. Select "Maximize".

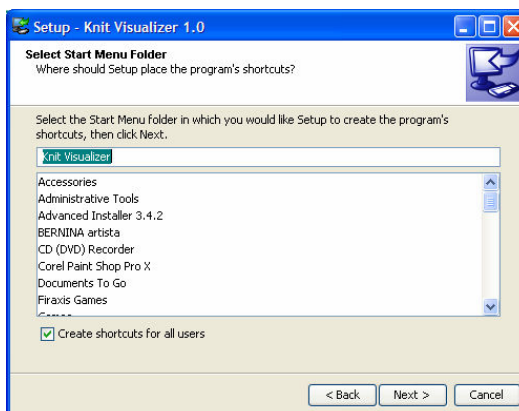

Destination Directory

Select where you would like to install Knit Visualizer. The default is C:\Program Files

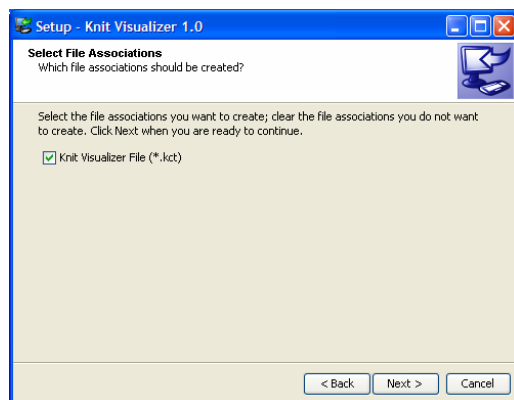

Select Components

You are required to install the Program & Libraries. Installing the Sample Charts is optional. It is recommended to install the Sample Charts so you will be able to view some pre-existing charts to get an idea of what you can create in Knit Visualizer.

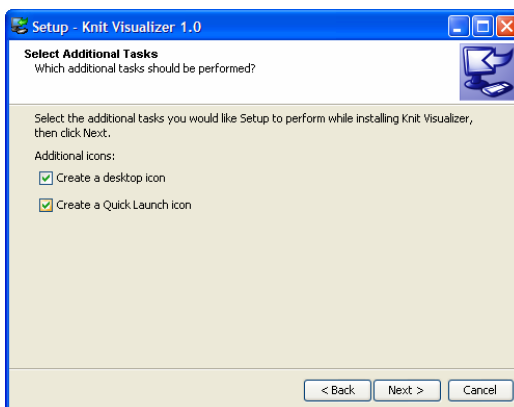

Select Start Menu Folder

In Windows, you access programs from the Start button, All Programs Menu. The default name of the folder placed there is Knit Visualizer.

Select File Associations

You can choose to associate the extension .kct with Knit Visualizer. This will allow you to open the application by double clicking on a saved chart file.

Select Additional Icons

You can create a desktop icon, and/or a quick launch icon. If you unselect both of these, you will still be able to access Knit Visualizer from the Start button, All programs menu.

Finish

After a progress dialog displays the files being copied, you will be shown this last screen. You can run Knit Visualizer immediately from this screen.

Mac OS X

System Requirements:

Mac OS X 10.4

Administrator privileges are recommended

Disk Space approx 5MB

Memory 512MB or higher recommended

Screen Resolution 1024x768

In order to use Knit Visualizer on your Macintosh, you must first verify the proper system files are available. Using the Finder, find the path: "Applications → Utilities → Java"

You should see J2SE 5.0 listed. If not, follow these directions to install the proper files

You can download the JDK from the apple site at

<http://www.apple.com/support/downloads/java2se50release3.html>

(There might be a later version available, Check <http://developer.apple.com/java/download/> for info)

When the download completes, you'll be prompted if you want to continue installing or not. Select "Continue" several times, Agree to the license agreement, Continue until prompted for the Administrator password (enter it). You should finish with a message "The software was successfully installed"

You can also use the Software Update mechanism to find and install the new version of Java. Refer to the documentation included with your computer for how to use the Software Update tool.

Install Knit Visualizer on Macintosh: Download

You will download a file named* `KnitVisualizer 1.1.dmg` . After the download is complete, your system should automatically mount the file as a drive for you. As the file is mounted, you will be prompted to agree to the license to use Knit Visualizer (unless you're installing the Demo). Agree to the license, and once the file is mounted, open the Finder application and open the mounted drive, to find see the Knit Visualizer app and the Sample Charts directory. Simply drag the application to your desired location. If you use `/Applications`, then you will need to authenticate as an administrator on your computer. If you use your user `~/Applications` directory, you won't need admin privs. You may copy the Sample Charts directory to anywhere on your system.

Install Knit Visualizer on Macintosh: CD

Put the CD into your CD drive. Open the Knit Visualizer CD icon. You'll see a Mac OS X directory. Browse to that directory, then simply drag the Knit Visualizer application to the desired location. If you use `/Applications`, then you will need to authenticate as an administrator on your computer. If you use your user `~/Applications` directory, you won't need admin privs. The Sample Charts directory at the root of the disk is valid for both Windows and Mac systems - You may copy the Sample Charts directory to anywhere on your system.

Once the installation is complete, you can Eject the temporarily mounted drive from the File menu.

* Version number might be different

Running the program

Windows XP

Double click the Knit Visualizer.exe file from the Windows File Explorer, or click on the desktop or quick launch icon created during installation. The splash screen will appear while the application is being loaded. Once the main window is visible, you may begin editing and creating charts.

Mac OS X

Browse to where you installed the application and double click the icon. The splash screen will appear while the application is being loaded. Once the main screen appears, you may begin editing and creating charts.

A note on keyboard shortcuts: Throughout the manual, keyboard shortcuts will be listed for most operations. They will be listed as "Control-<key>". On the mac substitute "Command" for the word "Control" and the shortcuts will work as described.

UnInstalling Knit Visualizer

To uninstall Knit Visualizer, simply find the Knit Visualizer Uninstaller (on Windows). Double click the item, and follow the prompts. Any charts you have created or altered in your Knit Visualizer program directory will remain after uninstallation. Please note you will not be able to read .kct files once the program is uninstalled.

For Mac OS X, you simply drag the application to the trash can.

Change History

This section details out changes made to Knit Visualizer since it's original release. More recent changes are listed first.

Version 1.2 (of Manual) August, 25, 2006

- Added information about screen resolution

Version 1.2, August 9, 2006

- Added Insert menu with commands to Insert Column(s) to the Right/Left & Insert Row(s) above/below
- Added stitch definition for sl2kww1p2sso (was missing previously)
- Added new stitches: k4tog, k5tog, k6tog, k7tog, p4tog, p5tog, p6tog, p7tog, nupp, incr4, incr5, incr6, incr7
- Changed Stitch Palette to separate knit related decreases from purl related decreases
- Bug fix: Exception being thrown when parsing a multi-cell stitch on as a wrong side row
- Bug fix: pattern instructions generated for multi-cell stitches were incorrectly counting number of times to repeat the stitch.
- Enhanced pattern instruction generation to recognize when a multi-cell stitch is interrupted by another stitch and change instructions accordingly
- Changed Chart Preferences to Chart Properties to better describe what it does
- Added Application Preferences to allow user to set stitch used when deleting cells, and inserting new rows/columns

Version 1.1

- Mac OS X version available
- Added ability to generate written out instructions from your chart from the Preview window
- Modified layout of Print Preview Window, set default view percentage to 50%
- Added key bindings for common commands in the File menu
- New Chart Preferences Key Binding : Control-[(left square bracket)
- Cancel out of Preview, Print Preview, Chart Preferences dialogs using the Escape key
- Changed key bindings for increase/decrease font size from arrow keys to +/- keys
- Added Border Keybindings (using the keystroke is just like pushing the button):
 - Control-T Add Top Border to current selection
 - Control-B Add Bottom Border to current selection
 - Control-R Add Right Border to current selection
 - Control-L Add Left Border to current selection
 - Control-0 (that's a zero), Remove all borders from within the current selection
 - Control-; (that's a semicolon), Add borders around all *edges* of the current selection
- Added binding to "S" key. Type S to switch between paint and select mode. Keep an eye on your cursor to see which mode you're currently in
- Remember the last Layout used in the Preview window; even after quitting Knit Visualizer
- New Symbols: make 1 right, make 1 left
- On startup, re-loads the last chart you were working on when you quit

Learning the Main Window

There are several different areas of the screen that you should familiarize yourself with, as shown in *Figure 1*.

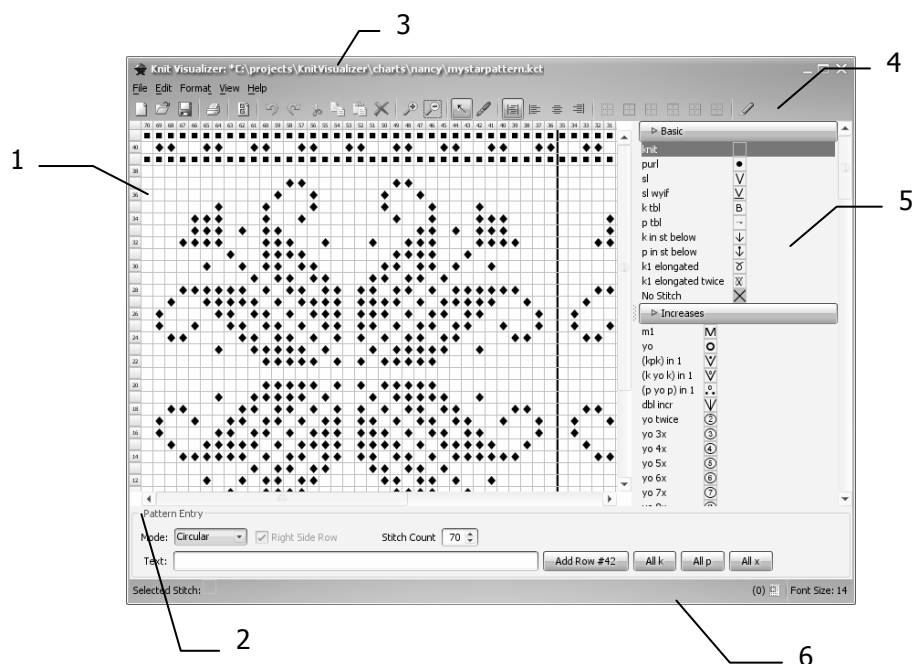

Figure 1: Knit Visualizer Main Window

1. Chart area
2. Pattern Instruction Entry area
3. Title Bar, shows location of file and indicator if file is unsaved
4. Menubar & Toolbar
5. Stitch Palette
6. Status Bar

This Manual will cover everything you need to know to create charts with Knit Visualizer. As a quick overview, you work with the chart in the Chart Area (1), selecting/copying/inserting rows, columns and cells, painting stitches and other operations. Each cell in the chart represents one stitch in your knitting. Sometimes it's a combination of stitches that make up a more complex stitch, such as a cable.

You use the Pattern Entry (2) area to type in pattern rows such as "k1 p2 (k2tog yo) 5 times".

The Stitch Palette (5) is what you use to select the stitches to paint in the Chart Area.

The Status Bar (6) gives you information about the size of your current selection, the currently selected stitch and the font size used to display the chart on the screen and when printed.

When the application first starts up, the chart area will either contain a blank 10x10 chart, automatically created or you, or the last chart that you had open (as long as it was also successfully saved). If the chart area is empty (such as it would be after creating a New chart with 0 rows and 0 columns, or using the Clear Chart command), there is still a chart present – it just happens to contain no rows or columns.

It is often best to begin using the Pattern Entry area with an empty chart. Alternately you can create a 'blank canvas' chart, that contains all knits, purls or Empty stitches from the New Chart dialog. Read the relevant sections for more details on how to use Pattern Entry and the Chart drawing tools.

Menus & Toolbar buttons

All the commands you need to access can be found either in the menus and/or in the toolbar. Many of these commands have keyboard shortcuts associated with them. This section will go over each of these commands and tell you what they do. While most of these commands are common to most software applications, there is information here that goes beyond how to open a file.

Each section also lists the keyboard shortcut, if there is one, for that command. On Windows system this shortcut will always start with Control. Mac OS X users would use Cmd (the fully little apple symbol) instead. Also, on the Mac OS X platform, some menu items are included in a menu that is named "Knit Visualizer" instead of on the File or Help menus.

Knit Visualizer Menu – About Knit Visualizer

[Mac only] This command performs the same task as described below in the Help Menu – About Knit Visualizer.

Knit Visualizer Menu – Preferences

[Mac only] This command performs the same task as described in View Menu – Application Preferences.

Knit Visualizer Menu – Quit Knit Visualizer

[Mac only] Exits the application, prompting you to save the current chart if unsaved changes have been made.

 Command-Q will invoke this command

File Menu – New Chart

Creates a new chart with prefilled cells.

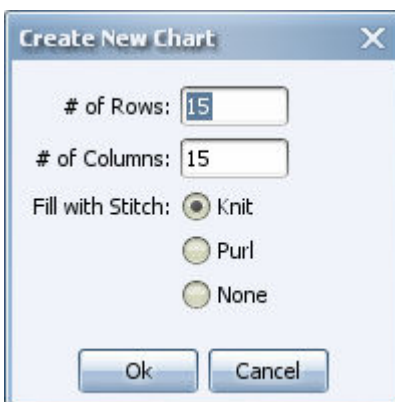

Figure 2: New Chart Dialog

You can enter the number of rows and columns, and a default stitch for each cell to contain. To create an empty chart when you want to use the Pattern Entry mode, enter 0 (zero) for both # of Rows and # of Columns.

Before creating a new chart you will be prompted to save the existing chart if there were unsaved changes.

★ Use the Tab key to move between fields. The Enter key will close the dialog, as if you had pressed the "Ok" button. Use the space bar to select a radio button, once you have tabbed to it.

File Menu – Open...

This allows you to open a chart you have previously saved to your file system. Knit Visualizer chart files all have the kct extension. By default, charts are saved in the `charts` directory inside the Knit Visualizer installation; but you can store them anywhere on your file system.

If the existing chart is unsaved, you will be prompted to save it before opening another one.

★ Keyboard Shortcut: Control-O will invoke the Open command

File Menu – Open Recent

Knit Visualizer keeps track of the last ten charts you opened/saved in this list for you to easily choose a recently opened file. Selecting a filename from this list will open the file. As always, if the currently displayed chart has not been saved, you will be prompted to save it before opening the new chart.

File Menu – Save and Save As...

At any point when working on a chart, you can save it to your file system as a .kct file. This allows you to work on the chart again later, or share it with your friends who also have Knit Visualizer. If the chart has already been saved once, using "Save" will save it again to the same location. "Save As..." lets you give a new filename to the chart. All charts are saved with the "kct" filename extension.

★ Keyboard Shortcut: Control-S will invoke Save when you are in the main window.

You can tell if a chart has not been saved by looking at the Knit Visualizer's title bar. The filename of the current chart is shown there. A chart that has never been saved will be shown as "untitled". If the chart has been saved, the filename will be shown, and an asterisk (*) will be in front of the filename when it has not been saved.

Figure 3: Title Bar showing unsaved changes

At any time if you try to do something that would close the current chart with unsaved changes, you will be shown this dialog:

Figure 4: Unsaved Changes Dialog

Answer "Yes" to be prompted for a place to save the chart. "No" means don't save, and continue whatever task prompted the dialog. "Cancel" will abort the task (such as Exiting the program) and take you back to the main window, leaving the unsaved chart still open.

It is always a good idea to save your work often in case the cat happens to walk across the keyboard, or your dog steps on the power plug and turns the machine off.

★ To dismiss the dialog without using your mouse, use the Tab key to navigate to the desired button. Press the "Space" key to invoke that button.

Don't try and open a kct file with a text editor. It's a binary format that is only understood by Knit Visualizer. You could corrupt your file and lose all your hard work. If you still want to take a peek inside, that's OK (I understand, really!), but make sure to not save it after opening it outside Knit Visualizer.

File Menu – Page Setup

The Page Setup dialog lets you view and change printing related options. You can select a paper size & source, the Orientation of the chart on the page, the margin sizes and the printer to use. The specific options available in this screen are dependent on your operating system and printer options available. Changes made in the Page Setup dialog are in effect until you close Knit Visualizer.

You must close the Page Setup dialog either via the OK or Cancel buttons before you can go back to the main Knit Visualizer window.

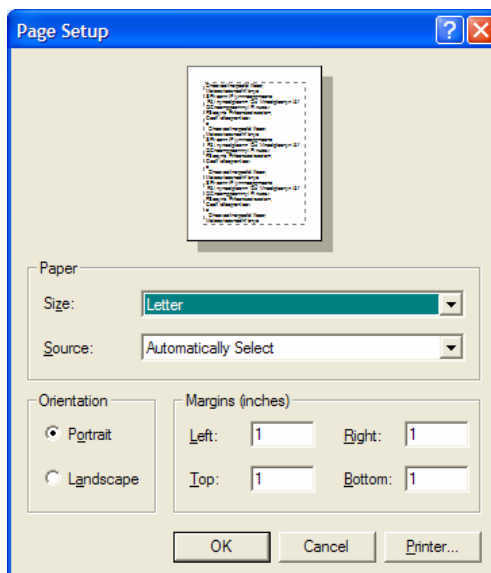

Figure 5: Page Setup Dialog

File Menu – Print... & Export as PNG

The two menu items **Print...** and **Export as PNG** both open the same dialog, the Preview Dialog. This is to allow you to choose what items you want included in your printout or image file. (See *Figure 6*). Both are included in the File menu to remind you of these important features.

★ Keyboard shortcut: Control-P will bring up the Preview window

By default the Preview Dialog shows the Title, Source, Chart, Legend and Pattern text. These field values are entered in the Chart Properties dialog (See the *View Menu* –  *Chart Properties* section for more details). A scroll bar shows up along the right side of the window if there is more information than can easily fit on the screen. Knit Visualizer tries to make the Preview Dialog as big as it can if you have a large chart. This is to show you as much as possible, and minimize the amount of scrolling you need to do.

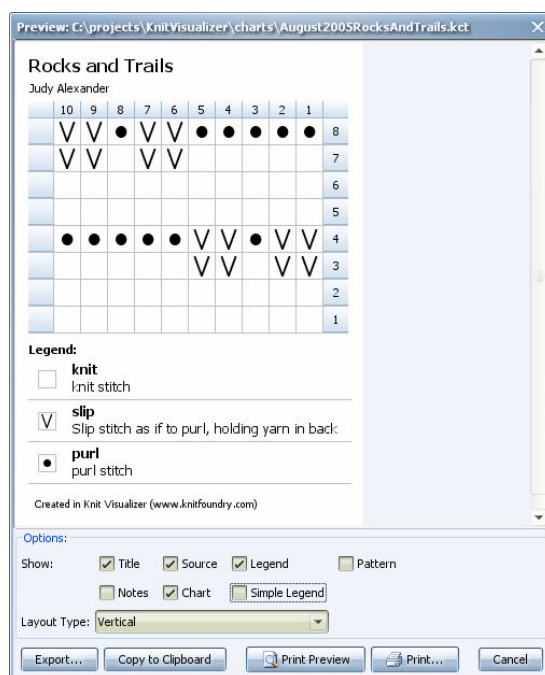

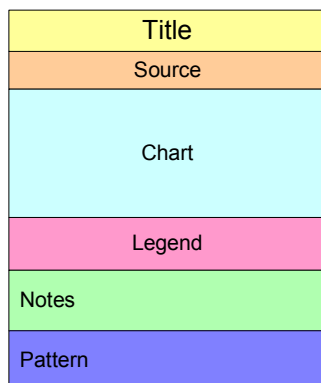

Figure 6: Preview Dialog

The size of the symbols in the Preview Dialog chart is the same size as the Main Window chart. If you'd like the chart to be smaller on paper, close the dialog, change the font size using the  toolbar button, then select Print... again. The smaller the font, the more chart will be able to fit on one piece of paper.

Uncheck or check the appropriate checkboxes to affect what you see in the Preview Dialog. What you see on this screen is exactly what will be printed, exported or copied to the clipboard.

Field	Description
Title	The title is displayed in a larger font across the very top of the chart.
Source	The source of the chart, in a smaller font than the title, displayed directly under the title.
Chart	The chart itself.
Notes	The notes entered in the Chart Properties Dialog.
Legend	The legend for the stitches in the chart. Only stitches included in the chart are displayed. Uncheck this box to hide the legend. The amount of information placed in the Legend is determined by the row

Slip stitch as if to purl, holding yarn in back

Notes:
This pattern was used in a sock for theknitter.com's sock of the month club in 2005. Pattern based on Diamond Fantasia pattern by Barabara Walker

Created in Knit Visualizer (www.knitfoundry.com)

We've shown the layout maps in color so you can see how each element type changes position. If an element is unselected in the Preview Dialog (eg. the notes or legend) that area will not be shown and the elements below the hidden ones will move up to take over that space.

The layout you choose depends on how many different symbols are included in your chart, the font size, note contents, and the chart width. Play around with the different layouts to find one that looks good with your charts.

Export

You can create a PNG file from the Preview Dialog. Click the "Export..." button and you will be prompted for a location to save the file. PNG files use the .png file extension. PNG stands for "Portable Network Graphic" and is a form of compressed image file that offers better quality than both GIF and JPEG. Once the file is saved to your hard drive, you can open it with any graphics imaging software, web browser, or similar application.*

Using PNG files is one of the best ways to include a Knit Visualizer chart in your own knitting pattern. Once you have created the PNG file, you can insert it into your pattern (in Microsoft Word, or any other editor that accepts image files) and resize it according to the space available. Also check out "Copy to Clipboard" that skips the save to disk step.

Copy to Clipboard

For pattern designers, both Export and Copy to Clipboard will be extremely useful features. When writing your pattern, you want to include your chart in the pattern. Once you have the chart looking exactly as you want it to, select "Copy to Clipboard". You now have in your clipboard buffer your chart (and whatever else you decided to show) ready to be pasted into your document.[†] All of the charts shown in the Layout section above were inserted using Copy to Clipboard.

* On very small charts, sometimes the image file created has a bit of extra white space around it. If space is tight where you are using the image, use any basic drawing program to crop out the extra white areas.

[†] This has been tested on Windows XP, with Microsoft Office 2003. If you have an older version of Microsoft Word, Copy to Clipboard might not work for you. Export to a PNG file first, then include that image in your document.

Print Preview

You can print directly to your printer using the Print button, or you can see how it will fit on the page(s) by using the Print Preview feature. Clicking the Print Preview button will show you this window:

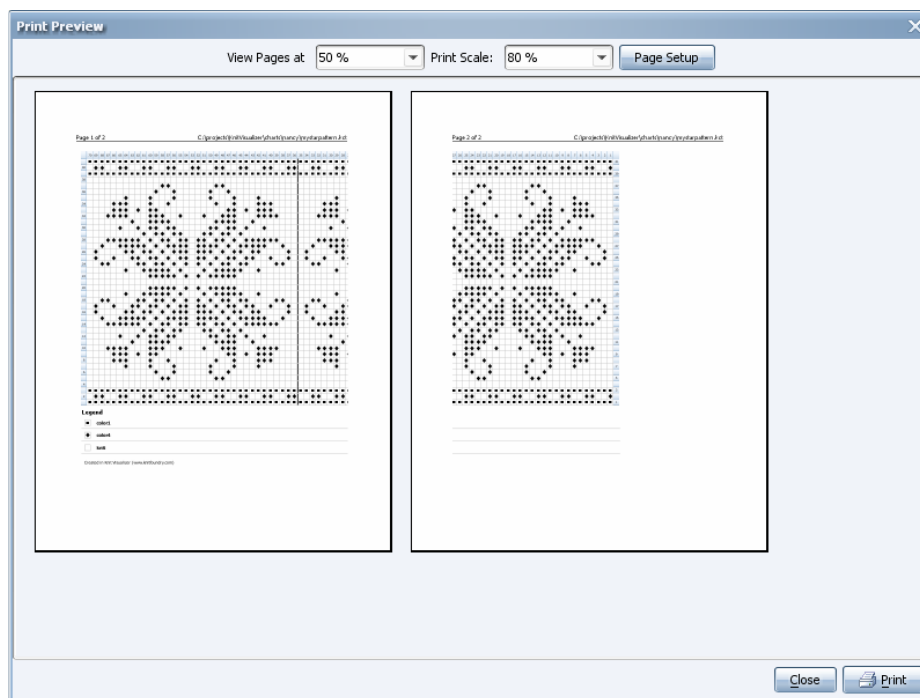

Figure 7: Print Preview window

The Preview Dialog closes when you bring up the Print Preview window. From this window you can perform the following tasks:

Task	Description
Page Setup	View and change paper size, orientation, margins, etc. This is the same command as File -> Page Setup
Print	Print the document as shown
Close	Close the dialog without doing anything
View Page at %	Select a percentage for viewing the pages. The smaller the percentage the more pages on the screen at once.
Print Scale %	Change the scale of the chart in the printout. This lets you squeeze the chart onto less pages.

Note that the Print Preview is fairly memory intensive as it has to render each page. When you change the Page or Print scale percentages, all pages are re-rendered at the specified values.

Print

You can print directly from the Preview Dialog without going through the Print Preview window by clicking the Print button. It will use the options as last set in the Page Setup dialog and print exactly what you see in the Preview Dialog.

Knit Visualizer places a header on the top of each printed page containing the page number out of total number of pages, and the save location of the chart file, if the chart has been saved.

File Menu – Exit

[PC only] When you choose this option, you are closing Knit Visualizer. If the chart you've been working on isn't saved – you will be given a chance to save it before exiting. You can also exit the application by clicking on the "x" in the upper right corner of the Main Window (on Windows machines) or the red circle on a Macintosh.

Edit Menu Concepts

Many of the Edit menu commands are only available when there is something selected in the chart; or when a previous selection has been copied or cut into the buffer. For details on how to select cells, rows or columns in your chart, see the *Select Mode* section.

A selection can be either a selection of rows, columns or individual cells. All selections are contiguous, meaning that you can only have one group of rows/columns/cells selected at one time, and only one type of selection at one time. There is an off-screen storage space, the buffer, where a temporary copy is stored when you do a Copy or Cut. This section of the Manual will explain details and limitations on each operation.

Edit Menu – Undo

Many operations in Knit Visualizer can be undone by clicking the Undo button or menu item. Any alterations to the chart: painting, deleting, inserting, pattern entry parsing (once it has been entered into the chart) can be undone. If you close your chart without saving, that can *not* be undone. You are given 50 levels of undo.

Some operations only count as one undo, even though it might have affected more than one cell in the chart. For instance, when you use the Shift key to paint the same symbol many times; all of the symbols painted while holding the mouse down are part of the same undo action.

★ Keyboard shortcut: use Control-Z to invoke Undo

Edit Menu – Redo

Once you have invoked the Undo command, you will be able to Redo that same command. If you Undo, then Redo – it is as if you didn't invoke either.

★ Keyboard shortcut: use Control-Y to invoke Redo

Edit Menu – Cut, Copy & Paste

All of these operations require that something a selection be present in the chart.

Cut will make a copy of the current selection into the buffer, and replace everything in the selection with the "No Stitch" symbol.

Copy will copy the contents of the current selection into the buffer.

Paste will fill the current selection with the contents of the copy-buffer. If the selection is larger than what the buffer contains, Knit Visualizer will repeat the buffer across and/or down to fill the space. You may not paste rows into a column Selection and vice versa, but you can paste cells into either row or column selections.

★ Keyboard shortcuts: Cut = Control-x Copy = Control-c Paste = Control-v

Edit Menu – Insert

This command has been moved to the Insert menu as of version 1.2.

Edit Menu – Duplicate

Duplicates the current rows/columns selection to the top/right of the chart. You cannot duplicate a selection of cells.

★ Keyboard shortcut: use Control-D to invoke Duplicate

Edit Menu – ~~X~~ Delete

Deletes the current selection. For cell selections, all cells are replaced with the "No Stitch" symbol. For row and column selections, the selected rows/columns are deleted out of the chart completely.

★ Keyboard shortcut: use the Delete key to invoke Delete

Edit Menu – Clear Chart

To create a completely empty (no rows, no columns) new chart, select Clear Chart. If the current chart has unsaved changes, you will be prompted to save them. This command has the same effect as File -> New Chart and entering 0 for both # of Rows and # of Columns.

Edit Menu – Mirror Selection (Horizontal & Vertical)

You can take the contents of a selection, and have Knit Visualizer mirror it vertically or horizontally. When you invoke Mirror, it takes the current selection and flips it around in the specified direction. This is not the same as rotating the selection. Note the position of the purl stitches in the following diagrams:

Original Chart

Mirrored
Horizontally

Original
Chart

Mirrored
Vertically

Some caveats on using Mirror - Horizontal. If you attempt to mirror a cable stitch, it will flip around the symbols inside the cable, and it won't look like anything useful when it's done:

Cable Before

After Mirror
Horizontal

Vertical Mirroring doesn't have that problem, as there will be no stitches spanning rows.

Mirroring works on any type of selection.

Insert Menu Overview

The insert menu contains commands that allow you to insert new rows or columns into your chart. All of the New Column or New Row commands work with whatever is currently selected in the chart. They will not be enabled if you do not have column(s) or row(s) selected respectively.

Insert Menu – Insert Copied Rows/Columns

This command is the only one on the Insert menu that requires you to have previously Copied a selection. It will not be enabled unless you have copied a selection of Rows or Columns, since this command does not work on cell selections.

NOTE: This is the same command that was on the Edit menu as "Insert" prior to version 1.2. For clarity it has been renamed and moved

Inserts the buffer into the chart based on the current selection's topmost cell (for rows) or left most cell (for columns). Only works if you have copied full row(s) or column(s) into the buffer.

★ Keyboard shortcut: use Control-I to invoke Insert

Insert Menu – New Columns to the Right/Left

Once a column selection has been made, you can now insert new columns to the right or left. However many columns are selected is how many new columns will be created. For instance if you have 1 column selected, and choose "New Columns To the Right", a single column will be inserted to the right of your current selection. If you have 3 columns selected, and choose New Columns to the Left, then 3 new columns will be created to the left of your selection. The new column(s) will be selected when the operation is complete.

Insert Menu – New Rows Above/Below

To insert new rows into your chart, select one or more rows, then choose New Rows Above or New Rows Below. Just like with the New Columns command, however many rows you have selected will determine the number of rows created. The newly created rows will now be selected in the chart.

Format Menu – Increase & Decrease Font

You can change the size of the font used to display the symbols in the chart using the Increase/Decrease Font commands. The font size is saved with the chart; so when you re-open the chart, it will have the same font size it did when you saved it.

★ Keyboard shortcut: Control-+ to increase font size, and Control-- to decrease the font size.

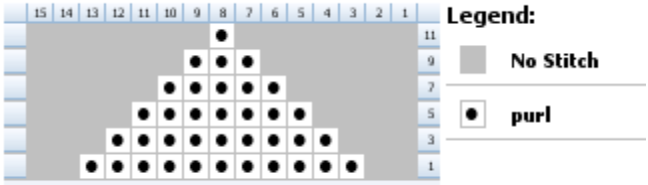

Format Menu – Justify

The items in the Justify menu only affect a chart that has the No Stitch included in it, and then only if those are on the edge. First though, we need to know what a "No Stitch" is.

The No Stitch Concept

In some charts, all the cells in the chart are real stitches. In other charts, the final piece has shape, such as in a sleeve, or a triangular shawl. Some lace patterns have increases on one row, and decreases on another row. To make the yarn-overs line up and look more like the final knitting, we need the ability to say "skip this space, it doesn't really exist" on those rows that have the decreases. Knit Visualizer uses the "No Stitch" symbol to represent these areas.

The Justify commands only affect a chart if there are No Stitch cells on the outside edges of the chart. Knit Visualizer decides how to allocate the No Stitch cells, based on the desired Justification. We will use an example chart to show the differences as you select the different Justifications.

Original Chart	
 None	Leave Justification as is. No changes to the chart, however the No Stitch cells are placed.
 Left	Justify with all symbols to the left, and No Stitches to the right
 Center	Justify with No Stitches to the left and right, balanced as possible. If there are an odd number of No Stitch cells, one side will have an extra No Stitch, but it will always be the same side.
 Right	Justify with all the symbols to the Right, and all No Stitches to the left

If there were any No Stitch cells in the center of the chart, those would be ignored, no matter what the justification setting. It is only the No Stitch cells on the left and right edges that are affected by the justification setting.

Keep in mind the purl stitches in the example could be anything; knits, increases, decreases and so on.

Format Menu – Borders

Many knitting charts like to indicate repeats within the chart by a line; or on very large charts mark every 10 columns and 10 rows. You can also use borders to help emphasize the cables in your cable patterns. See Figure 8 below.

Figure 8: Cable Pattern that uses borders for emphasis

Each of the Border buttons operates on the current selection, and with the exception of the **Borders – None** command, will add the border indicated by the command.

 **None**

For every cell in the selection (not just edge cells), remove all borders from those cells.

★ Control-0 (zero)

 **All**

Draw borders around the outside perimeter of the

	selection. Interior cells are ignored. ★ Control-;
 Left	Draws a border on the left side of the selection ★ Control-L
 Top	Draws a border on the top side of the selection ★ Control-T
 Right	Draws a border on the right side of the selection ★ Control-R
 Bottom	Draws a border on the bottom side of the selection ★ Control-B

View Menu – **Chart Properties**

Each chart you create in Knit Visualizer has a set of properties associated with it. In addition to changing the settings related to the row numbering, you may add a Title, Source, and Notes for a chart. See Figure 9 for what this window looks like.

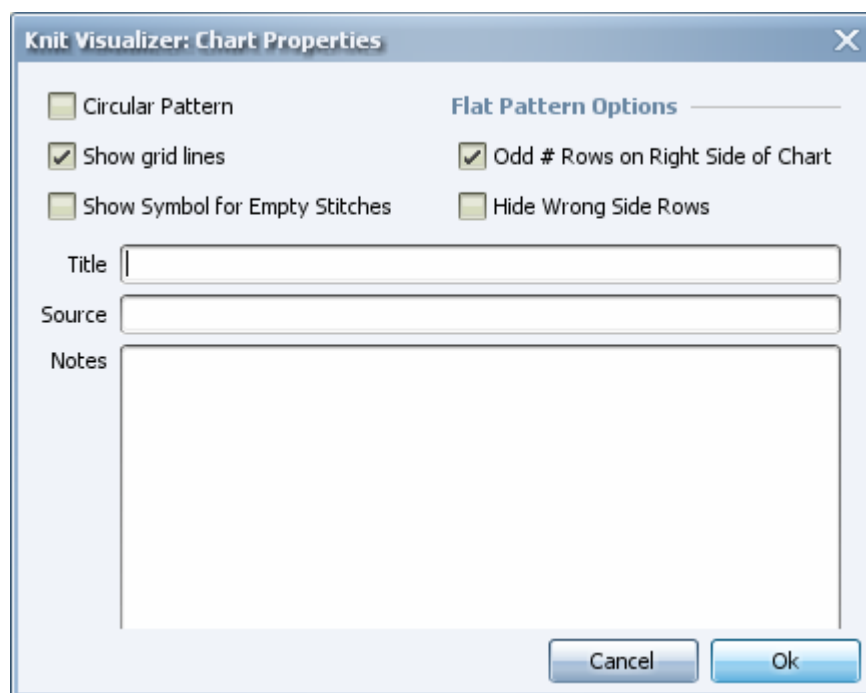

Figure 9: Chart Properties Dialog

Each of the options modifies the way the row numbers are displayed in the chart. No actual chart rows are removed if the row numbering options are changed; just the location of the row numbers. Chart Properties are saved with your chart save file, so when you open the chart again later, all the options will be reloaded as well. If you create a New chart, the Chart Properties will remain as currently set until they are edited. Click the Ok button to save the changes made in this dialog, and see them affect the chart. Click Cancel to close the dialog without saving any changes.

Circular pattern

When this option is selected, the row numbers are all displayed on the right side of the chart, and the Legend generated in the Preview Dialog only includes knitting instructions for Right Side rows. This signals to the knitter to knit every row from the front side, since you begin knitting each row on the side where the row number is. When the chart is marked as a Circular Pattern, All of the options under the Flat Pattern Options section will be disabled; as they will have no effect on the chart's row numbers.

Flat Pattern

If the Circular Pattern checkbox isn't checked, then the chart will be represented as a flat pattern. Row numbers will be included on both sides of the chart, according to the next two options. The Legend will be generated with both Right and Wrong side knitting instructions.

Odd # Rows on Right Side of Chart

This option is only applicable if the Circular Pattern checkbox is unselected. If this option is checked, then the chart will have the first row as #1 on the right (which is most common). When this option is unchecked, row #1 will be on the left.

Hide Wrong Side Rows

When this option is selected, it means that wrong side row numbers are not included in the chart. No rows are removed, only the row numbers are adjusted to reflect this option. If this option is selected, then there are no Wrong Side rows included in the chart, so the Legend generated in the Preview Dialog will not include Wrong Side instructions.

Show Grid Lines

You can hide the grid lines in the chart.

Show Symbol for Empty Stitches

The No Stitch stitch can also be called an empty stitch. The empty stitch will be depicted as an X on a grey background if this option is selected. If this option is not selected, then No Stitch cells will be shown with only the grey background, and no X symbol.

Title

You can give your chart a title, by entering the text in this field. This title is displayed when you Print or Export your chart.

Source

It's always a good idea to give credit to the original pattern source. You can list your name, the book and pattern the chart is based on, or any other information desired. This information can be displayed when you Print or Export your chart.

Notes

This area is for any notes related to knitting the chart. This can include information on where repeats begin and end, suggested yarn, even the text of a pattern to knit using the chart. The notes can be displayed when you Print or Export your chart.

★ Keyboard shortcut: use Enter to save preferences and close the dialog. Use the Tab key to move between fields. Use Control-[to open the Chart Properties dialog

View Menu – Application Preferences

New in v1.2! There are a few settings that affect more than just a single chart. You will find those options here.

Figure 10: Application Preferences Dialog

Setting Stitch used when deleting cells: When you select some cells (not rows or columns) and hit the Delete key, the application removes all the symbols associated with those cells. It has to fill the cells with something, and by default it fills with No Stitch symbols. If you'd like to always fill cells with something else, such as a knit stitch, change the option here. You can select from knit, purl and No Stitch.

Setting Stitch used when adding new Columns/Rows: Inserting empty rows by default will contain the knit stitch, you may decide to use a knit, purl or No Stitch by selecting it here.

All application preferences are remembered even after closing Knit Visualizer. If you Clear Preferences from the About Knit Visualizer dialog, these settings will go back to their defaults.

Pressing cancel will abort any changes you made in the dialog. Pressing OK will cause the selections to go into effect immediately.

★ Keyboard shortcut: use Control-comma to open this dialog quickly.

View Menu – Hide Pattern Entry Fields

To give as much space as possible on the screen to the chart, you can hide all the pattern entry fields. Simply select the Hide Pattern Entry Fields checkbox and the Pattern Entry fields are hidden from view. To show them again, select Hide Pattern Entry Fields again (which will uncheck the checkbox, and show all the fields)

View Menu – Themes

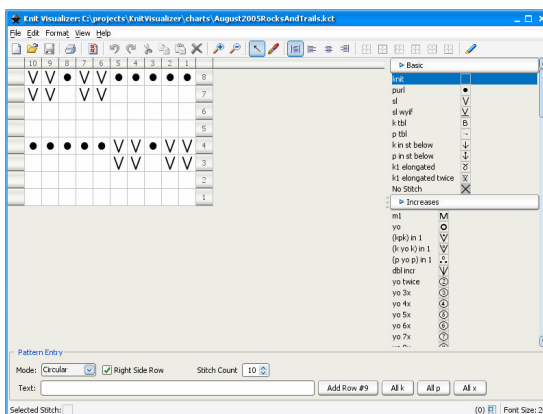

For Windows versions of Knit Visualizer the colors used to display the Main Window, dialogs and chart elements are controlled by the current Theme selected. Each Theme has a slightly different set of colors.* The default Theme choice you will see the first time you run Knit Visualizer is the Blue Ice Theme. The application will remember the last Theme you selected; and start with that Theme the next time you run. The currently selected theme is indicated by the selected Radio Button in the View Menu.

The Theme also affects the colors used in the chart that is printed/exported. The theme for the Mac version of Knit Visualizer will match the look and feel of the Mac operating system, and cannot be changed. 🍏

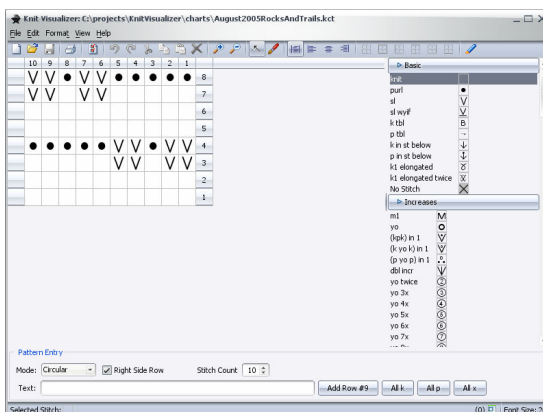

* Differences in monitors may affect the actual colors you see when you run Knit Visualizer.

Default Theme

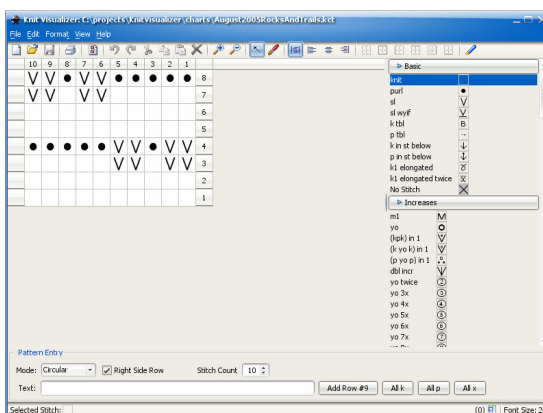

Will most closely match the look of the operating system. Example shown at right is on the Windows platform.

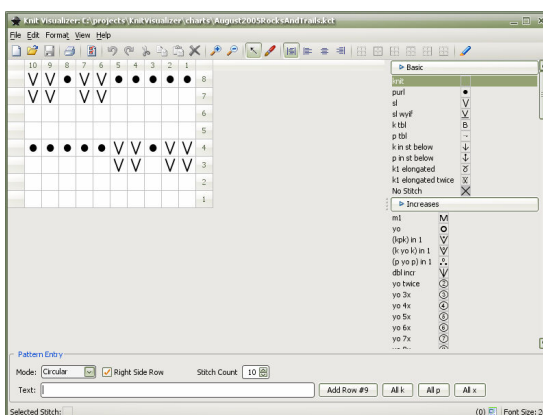

Silver Moon Theme

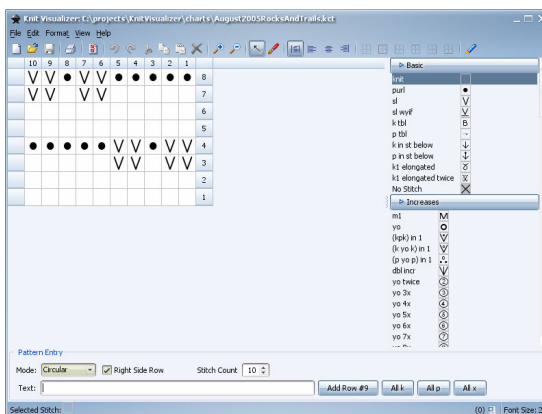

Blue Moon Theme

Green Dream Theme

Blue Ice Theme

Help Menu – About Knit Visualizer

To learn what version of Knit Visualizer you have installed, and where to get support, open the About dialog. Figure 11 shows an example About dialog. The text within this dialog may be different in your version of Knit Visualizer.

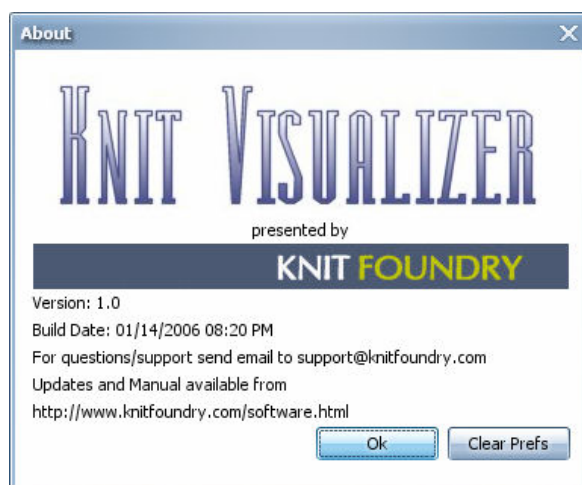

Figure 11: About dialog

Information from the About dialog might be needed if you have questions or need support. Click the Ok button to close the dialog.

The Clear Prefs button will clear out any application preferences saved, including the chosen theme, and recent files list. Preferences are not required for Knit Visualizer to function properly, but they are designed to make it easier to use. Note that the Recently Opened files list is not cleared out completely unless you close Knit Visualizer immediately after clearing the application prefs. Application Preferences are saved for you automatically as you perform actions (such as select a different Theme) in Knit Visualizer.

Toolbar Buttons

The toolbar provides quick access to the most often used actions in Knit Visualizer. You can hold your mouse pointer steady over a button to see a quick tool tip with information on what that button does. The following table shows each toolbar button, and a short description of what it does.

	Creates a new chart
	Open a chart from your hard drive
	Save the chart to the hard drive
	Print/Export chart
	View Chart Properties
	Undo last edit
	Redo last undo action
	Copy selection
	Cut selection
	Paste selection
	Delete selection
	Zoom out, make the font smaller
	Zoom in, make the font larger
	Select mode
	Paint mode
	Justify, None
	Justify, Center
	Justify, Left
	Justify, Right
	Border, Remove all
	Border, Add All edges
	Border, Add Left
	Border, Add Top
	Border, Add Right
	Border, Add Bottom
	Highlight all stitches in chart that match currently selected stitch in palette.

Some toolbar buttons might be disabled, meaning that action cannot currently be performed. For instance, the Paste  toolbar button is disabled if there is nothing in the buffer to be pasted. You'll see some of these same icons next to items in the menus – those have the same operation as the toolbar button.

Status Bar Information

The status bar is at the very bottom of the main window, and shows you some useful information as you work with your chart. See *Figure 12: Status Bar*.

Figure 12: Status Bar

On the very left of the status bar is the stitch that was last selected from the Stitch Palette. This is useful because the list of stitches in the Palette is very long, and the currently selected stitch might not be visible on the screen.

On the far right of the status bar is the font size currently in use. This number is in points. A 14pt font is as small as you can make the chart font in Knit Visualizer (otherwise you wouldn't be able to see any of the symbols!) If you play around with the Increase Font , and Decrease Font  buttons, you'll see this value change. If you wanted to pair two charts next to each other in a pattern (but not physically in the same chart), and make sure the cells were the same size, you'd check to make sure the font size was the same in both. The font size is saved as part of the chart, so whatever you select before you save the chart is what will be used when you re-open it.

To the left of the Font Size, is the size and type of the current selection. For more information on selections and how to use them, see the Selections section below.

Knit Visualizer Modes

If you were reading carefully*, you'd have noticed that there are two toolbar buttons that let you switch between the different modes in Knit Visualizer. The arrow  is selected when you are in Select Mode. The paintbrush  is selected when you are in Painting Mode. There is also a third mode, but one that doesn't have a toolbar button, because it's a special case: Parsing Mode. You use the Pattern Entry portion of the screen for typing in pattern rows and automatically generating symbols into new rows in the chart.

You can switch between modes in several ways. To enter Select mode, do one of the following:

- Click on the Select Mode  button
- Click on the chart's row numbers, or the chart's column numbers

To enter Paint Mode, do one of:

- Click on the Paint Mode  button
- Click on a symbol in the Stitch Palette

Knit Visualizer automatically puts you in the correct mode if you click on a stitch in the Stitch Palette, or if you click any of the row/column number headers.

You can easily tell which mode you are in because the mouse cursor changes to a paintbrush in the chart area when you are in Paint Mode and the appropriate mode button in the toolbar will be selected.

If you find that you have accidentally switched modes because you clicked in one of the areas mentioned above, simply click the correct Mode button in the toolbar to switch back. If you accidentally painted a stitch, use Undo (Control-Z) to remove that stitch.

Select Mode

The first mode (and the most intuitive for most computer users) is Select Mode. There are three types of selections in Knit Visualizer. The status bar will give details on the size and type of the current or most recent selection.

 Cell Selection	Once in Select Mode, click and hold in the first cell, then drag your mouse to add to the selection. The cells selected are highlighted in a different color. Check the status bar for details on the size of the selection
 Column Selection	Click on a column header, hold, then drag to select multiple columns
 Row Selection	Click on a row header, hold, then drag to select multiple rows

* You didn't know there'd be a test, did you?

We've already covered the details of using Copy, Paste, Cut, Insert & Delete when going over the Edit Menu. Knit Visualizer will give you a message if you try to Paste or Insert the wrong type of buffer into the wrong type of selection. Remember, there is always the Undo (Control-Z) feature to back out of the operation you just performed.

Once a stitch has been painted into the chart, it can now be "split up" by doing a delete, cut or paste through it. This is allowed for maximum flexibility when designing your patterns. Be careful to not chop up your stitches that are wider than one cell, unless you only want to knit the first few stitches of it. When the Legend is generated it will include that stitch and the knitting instructions for it even if only part of the stitch is present. This chart has the top cable that is still "complete" and the bottom cable has been split by a purl stitch being painted/pasted into the middle of it:

Paint Mode

You enter paint mode by clicking on the paintbrush  toolbar button, or by selecting a stitch from the Stitch Palette. The Stitch Palette contains all the different stitches you can use in your chart. Each stitch is comprised of one or more cells. You can see exactly what the stitch looks like by its entry in the Stitch Palette. Once you select a stitch you can then paint it by simply left clicking on the chart at the desired location. The new stitch will be painted from that cell and out to the right. The currently selected stitch (which is what will be painted) is shown on the far left of the status bar.

If you want to paint the same stitch many times all in the same area, you can hold down the Shift key, then left click and drag. Every new cell you touch will have the stitch painted into it (and in the cells to the right, if the stitch spans multiple cells). The Undo command will undo the entire paint operation when you are painting the same stitch many times using the Shift Key.

Navigating the Stitch Palette

The stitch palette is organized into groups of stitches, to make it easy to find the stitch you need. If you aren't interested in a group of stitches, you can hide that set by clicking on the title of the group. (See *Figure 13*).

To select a stitch, simply left click on it. It will now become the highlighted stitch, and you should see that stitch on the bottom left of the status bar. Any stitch previously selected will be unselected. You can only select one stitch at a time in the Stitch Palette. When you select a stitch in the palette, Knit Visualizer will be automatically put into Paint mode.

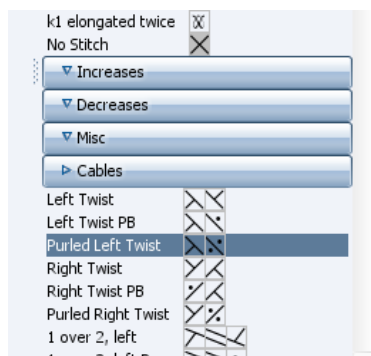

Figure 13: Stitch Palette with several groups closed

In Figure 13, The Increases, Decreases & Misc groups are all closed. To open them again, simply click again on the title bar for that group.

Each stitch comes pre-defined with a set of knitting instructions on how to make that stitch. You will see these instructions in the Legend in the Preview window or you can view this from within the Stitch Palette by holding your mouse steady over the stitch name.

If you'd like to see all instances of a stitch highlighted in the chart, select it in the Stitch Palette and click the Highlight Stitch  toolbar button. Those stitches aren't a selection (you cannot copy and then paste them), the highlighting is just a visual indicator to allow you to find them easier.

Pattern Entry Mode: Parsing Knitting Instructions

The Pattern Entry mode is an advanced mode in Knit Visualizer that helps you build a chart from a stitch pattern. All knitters seem to have extensive libraries of pattern books, stitch patterns and magazines. Not all of those pattern sources contain charts; but they do contain written out instructions. By using the Pattern Entry mode, you can create a chart from the written out instructions. You should treat this section of the Manual as more of a tutorial. It will be helpful to follow along by entering the example pattern instructions into Knit Visualizer, see what happens, and play around to see what changing different options does

The brains behind the Knit Visualizer's Pattern Entry function is the Parser. It reads what you type in, tries to understand it, then adds a row to your chart based on what it thinks you said. It's a bit like typing in German and getting English back out. Sometimes it won't know what you are saying and will give you a message that tells you where it became confused. There is no possible way for the manual to cover all the combinations you can enter in the parser; as the combinations are in some ways, endless. The parser might also be modified in future patches to parse additional combinations of stitches. We will cover the basics here to get you started.

What Can Be Parsed

The basics consisting of: knits, purls, most decreases & increases. Cables are difficult because there is no common syntax used to specify the same exact cable between different books. The best thing to do is to use the Paint Mode to fill in cables. This has the added bonus of letting you see which way the cables turn and you get a much better visual idea of how the pattern will look knit up.

There are several ways to specify repeats within a pattern row (see details in sections following). The parser was designed to parse most of the Barbara Walker Treasuries patterns, with the exception of cable stitches. The parser does understand the cable specification formats used in Nicky Epstein's *Knitting On*

the Edge and *Knitting Over the Edge* books. (E.g. 2/2rpc) The best rule of thumb if you get an error back from the parser is to always check for typos first, and then check for odd stitches.

Pattern Entry Area

The pattern Entry area is where you enter the text of the knitting instructions, and specify the options that will help the software determine how to perform the translation. The pattern entry area of the screen is shown in Figure 14.

Figure 14: Pattern Entry

You enter one row at a time in the Pattern Entry section. The options above the Text field tell the Parser what type of row to expect. Starting from the top left:

1. **Mode:** Circular or Flat. Circular will mean we are always entering a Right Side Row. Selecting Flat means we need to specify if the row is RS or WS. The parser will flip this back and forth for us as we enter rows.
2. **Right Side Row:** If this box is selected, then you are entering a Right Side Row. Ignored if Circular is selected.
3. **Stitch Count:** How many stitches will this row consume? This should match the number of stitches in the row you already entered. The parser automatically adjusts this value for you as you enter new rows*. This is very important if there are repeats in the pattern, and you want the parser to fill across the size of your chart. You can type in a value, or click on the arrows to change the value.
4. **Text:** The area where you type (or paste in) the pattern text (★ You can use the up/down arrow keys to change the Stitch Count while typing in text)
5. **Add Row #:** Button to click when the pattern text is ready to be parsed (★ Pressing the Enter key in the Text box does the same thing)
6. **All k:** A quick method to enter all knit stitches. Uses the value in Stitch Count for quantity of stitches. Clicking this button is equivalent to typing in `[k]` and clicking Add Row #.
7. **All p:** A quick method to enter all purl stitches. Uses the value in Stitch Count for quantity of stitches. Equivalent to `[p]`
8. **All x:** A quick method to enter all No Stitch (Empty) stitches. Uses the value in Stitch Count for quantity of stitches. Equivalent to `[x]`

As you enter pattern rows, it is important to keep an eye on these values to make sure they are what you expect. Sometimes just the Right Side Row checkbox being set incorrectly will give you very different

* Sometimes you don't want this to be the exact number of the row already entered. There are cases when entering repeats that the number of stitches specified after the repeat is excessively long. For instance: `k2 k2tog *yo ssk k1 k2tog yo sl2knitwise k1 p2sso rep from * end yo ssk k1 yo ssk k2`. The repeat is calculated before the parser sees the stitches after the "end"; and then tacks all those stitches on. When you see the chart it will be obvious it added a few extra stitches.

results! *Before following along in these examples, please verify your Chart Properties are set to the following: Circular Knitting OFF, Odd # Rows on Right ON, Hide Wrong Side Rows OFF.*

The parser ignores all punctuation (commas, semicolons, etc) & most white space (with some notable exceptions). You can type upper or lower case letters.

Simple Parser Example

If you have selected "Flat" knitting, after you enter a row, the parser will change the state of the Right Side Row checkbox. For instance if you start with "Flat" selected, and Right Side Row selected. You are telling the parser you are entering a pattern that was written for knitting back and forth, and the row you are going to type in is a right side row. Stitch Count is set to 10. You then type in

```
k2 p2 yo k2tog p2 k2
```

and press the Enter key. The parser adds the first row to the chart:

	10	9	8	7	6	5	4	3	2	1	
			●	●	/	○	●	●			1

Figure 15: A Simple row entered via Parser

Now, the Right Side Row checkbox is automatically unselected, in preparation for the next row. Also the button Add Row# now has the text "Add Row #2". Hit Enter a few more times to see what happens. Notice how the Right Side Row checkbox keeps turning itself off and on, and the Symbols entered for the Wrong Side rows are different than those for the Right Side Rows. Also the Row # in the Add Row button increments to tell you what the next row will be.

Now you can use the Undo key (Control-Z) to remove those rows you just added, until there is only one left. The Add Row # button adjusts, but the Right Side Row checkbox doesn't check/uncheck during the Undo. This is because the parser assumes you are Undo-ing an error in the last entry, and that error might have been selecting the wrong type of row. It doesn't want to guess wrong, so it leaves it alone. The lesson in this is always check to make sure the Right Side Row checkbox is selected/unselected as you want it.

IMPORTANT: There are limitations to what the Parser can understand. There are so many different ways of representing the same basic knitting stitches, that it would be impossible to understand them all. The more complex the pattern, the less likely you will be able to enter it exactly as written. It is best to start with very simple examples, understand how the parser thinks (believe me, it has a mind of it's own) before moving on to more complex patterns. This section will give you ideas on how to make it understand the pattern you want to enter, but there are no guarantees. It is possible the parser will pretend to understand the pattern, but spit out a different stitch than you think it should. Always check your chart!

Entering Repeats

The parser can understand repeats and how to use them to fill out an entire pattern row. When entering stitch patterns via the parser, it's best to do at least two repeats worth so you get an idea of how they work together. Let's say we are working on the Lace Puff pattern from Barbara Walker's A Second

Treasury of Knitting Patterns (page 283)*. That pattern is a Multiple of 12 sts, plus 2. That means there are 2 edge stitches, and 12 stitches in each repeat. If we want to enter this pattern, we should execute Edit -> Clear Chart if another chart was present and set up the Parser as follows:

Stitch Count: 26 (We get this number from adding 12 + 12 + 2)

Mode: Flat

Right Side Row: Selected

Text: `k1 * ssk k3 yo p2 yo k3 k2tog rep from * end k1`

Resulting Row:

26	25	24	23	22	21	20	19	18	17	16	15	14	13	12	11	10	9	8	7	6	5	4	3	2	1	
					○	●	●	○				○	●	●	○										○	1

If you happen to have the BW books, you'll notice that the actual text in the book was this:

K1, * ssk, k3, yo, p2, yo, k3, k2 tog; rep from *, end k1

The parser ignores all those commas, so there's no point in typing them in. We leave the spaces for clarity, although habit made me leave out the space in the "k2 tog" because I normally type k2tog. Either will be recognized by the parser. For the parser to recognize the * rep from * repeat, you must include the single spaces the the "rep from *" portion of the pattern. Given that adding spaces is a natural tendency, this shouldn't be a problem; but it is something to keep in mind.

The Stitch Count you enter is important because it tells the parser how many times to repeat the stitches in between the repeat indicators. If you accidentally enter 27, 28 or even 29; it's Ok, the parser will probably make a good guess and still only create 26 stitches. It's not until you get up to 38 (which is 3 repeats + 2 edge stitches) that it will actually create 3 repeats in the chart. If you don't get the number of repeats you expect, you can always use Undo, change the # of stitches and try again.

There are multiple ways to specify repeats, and the parser doesn't care which one you use. A lot of patterns use the * <stitches> rep from * syntax, but you might also see it written like this:

`k1 (ssk k3 yo p2 yo k3 k2tog) end k1`

The means exactly the same thing as the original text. We've changed the first * to a (and the rep from * to a). You can use pairs of parentheses () or square brackets [] or curly braces {} all in the same fashion. Make sure you always use them in pairs; as the first one tells the parser, "Attention, I'm going to enter some stitches to repeat" and the second one says, "The repeat is finished now, take all those stitches and repeat as indicated". If one of them is missing, as in this line:

`k1 (ssk k3 yo p2 yo k3 k2tog end k1`

you'll see an error message like this one:

Figure 16: Parser Error Dialog

Whoops! Click Ok, and go back to fix the text. Verify that the Right Side Row checkbox is selected before re-adding the row.

* You'll find the complete chart for this pattern in the Sample Charts directory, named LacePuff_BW2_pg283.kct

Let's continue entering the Lace Puff pattern. We've successfully entered the first Row. Verify your settings:

Stitch Count: 26 (We get this number from adding 12 + 12 + 2)

Mode: Flat

Right Side Row: **UNSelected**

Text: `k1 *p2tog p2 yo k4 yo p2 p2tog-b rep from * end k1`

After entering the second row, the chart now looks like:

Row 3: RS row, Text: `k1 *ssk k1 yo p6 yo k1 k2tog rep from * end k1`

And so on, until you have finished all 8 rows in the pattern. Edit the Chart Properties, and enter the title (Lace Puff) and the source (BW#2, pg 283) and whatever notes you'd like. Make sure and save your work! The finished chart looks like this:

Lace Puff

BW #2, pg 283

Created in Knit Visualizer (www.knitfoundry.com)

Figure 17: Lace Puff Chart for Flat Knitting

When I created this image in the Preview Dialog, I selected Horizontal Layout, Turned Simple Legend On to remove the stitch instructions, and didn't show any notes. I used Copy to Clipboard to bring the image into this document.

If you look at the picture in the Barbara Walker book, you'll see that this image matches very closely to the actually knitted item! If you'd like to convert this chart to knit something circularly, all you need to do is remove the outer two columns, which are edge stitches for when it is knit flat; and change the Chart Properties dialog to select "Circular" (modifying the location of the row numbers in the chart):

Lace Puff

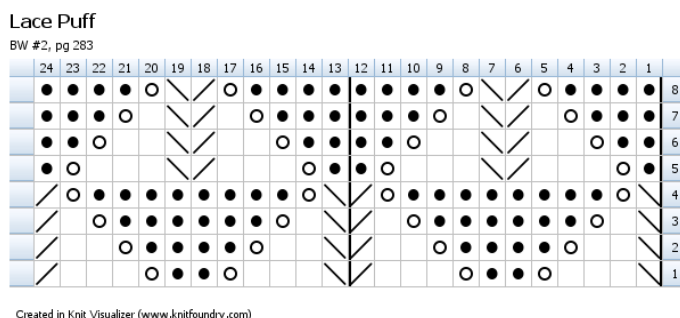

BW #2, pg 283

Created in Knit Visualizer (www.knitfoundry.com)

Figure 18: Lace Puff Chart for Circular Knitting

Remember that there are two full repeats shown in Figure 18. You might want to indicate the repeats by using borders, as shown in Figure 19.

**Figure 19: Lace Puff using Borders to show repeats**

A Few Caveats

The parser will also automatically change the Stitch Count to match the last row you entered. 95% of the time this will work and you won't have to think about it. Every once in a while a row will be entered that will be way too long for what you really want. This is due to the way it counts repeats and adds on stitches after the repeats are completed. Usually it means one too many repeats has been entered. You can use Undo, then change the Stitch Count to a smaller value, making sure the Right Side Row checkbox is set correctly, then hitting Enter.

Quantified Repeats

In many patterns, there will be a grouping of stitches and a quantity to tell you how many times to work those stitches. From another pattern, that has a Multiple of 10 sts plus 2:

Stitch Count: 22

Mode: Flat

Right Side Row: Selected

Text: `k1 * (s11 wyib, s11 wyif) twice, s11 wyib, p5 rep from * end k1`

In this pattern, the * indicates that a repeat is starting. The (indicates another repeat is starting. After the end) is found, the parser sees the text 'twice', it knows to take the stitches in between the parentheses and use them two times. Then the parser continues reading the text and sees "rep from *". It knows that repeat is now completed; and fills out the remainder of the chart, ending with a single knit stitch.

Here are some examples to get you used to what style of quantified repeats the parser will accept:

(p2 k2) twice

(p2 k2) 2 times

[p2 k2] 3 times

[p2 k2] once

{ p2 k2 } 1 times

Remember, you can combine different types of repeats by *nesting* one repeat inside another like this:

[p1 (k1 yo) 3 times]

Make sure that you don't confuse the end parens though. This would be incorrect

WRONG: [p1 (k1 yo) 3 times)

The parser will give you an error as it must finish the () repeat before it can finish the [] repeat.

Changing the way the last repeat of the row ends

Often the very last repeat of a pattern row is slightly different for whatever reason. To change the last repeat you can do this:

```
p4 *yo p2tog p9 p2tog-b yo p7 rep from * end last repeat p4
```

Make sure and type in "end last repeat" just like that with only single spaces. This is one of those cases that the parser requires the spacing to be absolutely perfect. If you add an additional space it will get confused and not know what to do. Many of the patterns in Barbara Walker's books use this type of syntax.

Basic Stitches

This section will go over most of the basic stitches you can enter.

The following are all equivalent:

```
kkkk
```

```
k4
```

```
knit 4
```

or using purls

```
pppp
```

```
p4
```

```
purl 4
```

```
p2p2
```

```
sl1 (slip 1)
```

```
sl3 (slip 3 stitches)
```

```
sl wyif
```

```
sl wyib (same as a normal slip stitch)
```

```
k tbl
```

```
p tbl
```

```
k in st below
```

```
p in st below
```

```
x (empty stitch)
```

Increase & Decreases

```
yo
```

```
m1
```

```
m3 (puts three m1 stitches right next to each other)
```

```
knit purl knit in 1 stitch
```

```
k2tog
```

```
k2tog tbl
```

```
ssk
```

`k2tog b` (same as `k2tog tbl`)

`p3tog`

`k3tog`

`p3tog tbl` (the parser does NOT like `p3tog b` even though this should mean the same thing)

`sl1 k2tog pssso`

`sl1 p2tog pssso`

There are so many combinations/variations of `sl1 <stitch> pssso` that it's impossible to have symbols for them all. There are a few provided in the Stitch Palette that you can use if you like them.

Special Stitches

`cluster2`

`cluster5` (and all those in between. Won't go larger than 5)

`mb` (means Make Bobble)

Cables

The parser understands cables that follow this syntax:

`cXoverY<l/r>[pb]`

Read this as "Cable X stitches over Y stitches To the Left/Right (With Purl Background)". Some examples will help clarify this:

Parser	Stitch Palette	Meaning
<code>c1over3l</code>	1 over 3, left	Cable 1 over 3 stitches, leaning left
<code>c1over3r</code>	1 over 3, right	Cable 1 over 3 stitches, leaning right
<code>c3over2rpb</code>	3 over 2, right P	Cable 3 over 2 stitches, leaning right with a purled background
<code>c4over1rpb</code>	4 over 1, right P	Cable 4 over 1 stitches, leaning right with a purled background

If you specify "pb" at the end, the instructions and symbol will have purled stitches behind the cable. Using l for left means the cable crosses to the left, Using r for right means the cable crosses to the right.

When entering patterns that have cables, the parser will most likely *not* understand the format used in your pattern. If you can't easily substitute the above syntax for cables for what the pattern specifies, use a number of No Stitch cells to be place holders for a cable (`x4` or `x8`), and then paint the cable in later from the stitch Palette. Cables in Knit Visualizer can go all the way up to 4 over 4. The parser will understand larger cables, but there aren't symbols to display for them. You'll see a bunch of question mark symbols in the chart where the cable would be.

How to Handle Non-Pattern Instructions

"Knit all the knits, Purl all the Purls"

Simply copy the last row worked, and Duplicate (Control-D) it to the top.

If you do this every other row (where you'd be doing Wrong Side rows), make sure "Circular" is selected, and "Right Side Row" is selected, then you can simply hit ENTER twice to enter the same row again. If there are more than just purls and knits in the row, use the stitch palette to fill in the correct stitches

"See Row X" or "Same as Row X"

Select the Row indicated by clicking on the row number (either to the right or left of the row) and Duplicate (Control-D). The works when the pattern row is for the same side both times. This won't work if Row X is a wrong side row, and the new row is a right side row. Then you'll have to type in the pattern instructions for that row again so that Knit Visualizer can parse it as the correct side row.

"Row X: Knit"

This really means knit ALL stitches, not just knit one stitch. Make sure the stitch count is set correctly, and then press "All k" button. Or you can type in "[k]" or "(k)" into the Instruction Field. The same applies for rows that should be all Purl stitches.

You can create a bunch of blank rows at the top of the chart easily, but pressing the "All x" button. Each time you press this, it will create a row that contains the "No Stitch" placeholder. You can then paint stitches with the Stitch Palette.

How Many Repeats To Enter

When entering a pattern that has repeats, it's a good idea to enter at least two repeats. For instance if your pattern is a "Multiple of 8 sts plus 1", you should enter "17" for the Stitch Count field. This is very useful if you don't want to start the repeat in the same place the pattern did. Looking at multiple repeats across (and down) will help you see it in a different way.

Keeping Track of Which Row Comes Next

The "Add" button will always tell you which row is the next one to be entered. This is true if you type in a row, or select one and Duplicate it using Control-D. If you copy and paste a full row into the middle of the chart, the button will adjust itself to use the next number in line.

Always check the "Right Side" checkbox to make sure it matches which side you are trying to enter next. If you enter one, and Undo (Control-Z), it doesn't modify the checkbox's status.

Parser Limitations

It is impossible to know all the different names for knitting stitches in the various books & patterns. Knit Visualizer has tried to come up with a good standard set to use, along with quite a few aliases for some stitch names. (For instance you can enter either ktbl or k-b or kb)

What To Do When Things Look Really Wrong

If you get an error message, you are entering something the parser doesn't understand, or it's possible you had a typo when you entered the pattern row. You could have the wrong number of stitches in the Stitch Count field. The Right Side checkbox might have been selected when it shouldn't have been. Use Undo (Control Z) to remove the last row entered, and verify the text you entered, then try again. Whenever using Undo or Duplicate always check to make sure the Right Side checkbox is selected correctly for the next row.

You might also see a question mark symbol in the chart. That means the parser recognized something that looked right, but it didn't know what symbol to assign to it.

Parsing vs The Stitch Palette

There are stitches on the palette, that you won't be able to put on your chart by parsing text. An example is "yo twice". This, and other stitches are included in the palette so that you can include it in your charts. If you find a strange stitch in your pattern instructions that the parser doesn't understand

it's best to enter a place holder for them. You can use any stitch you want, but it might be easiest to find those placeholders by using something not commonly included in your patter such as the empty stitch:

```
k5 p2 x5 p2 k5
```

Here we've put in 5 empty stitches for a 5 stitch cable. The parser will include the empty stitch as place holders, and we can paint the appropriate looking cable on top of them once we get far enough into the pattern to decide what will look best.

Tips and Tricks

For more tips and tricks, please see our website <http://www.knitfoundry.com/software.html>

- To generate the pattern text for your chart, click on the Print button. You'll see the Preview window and one of the elements in that window is the pattern text. You can print it directly from there, or if you'd like to get just the text for the pattern for another document, select the pattern text using your mouse cursor and type Control-C to copy. Change to the other application (either notepad, MS Word, or other word processing software) and then type Control-V
- To include your chart in a pattern where you want the legend in a separate location than the chart, export one image file with only the chart, and one image file with only the legend. You can then move them around independently to work with whatever formatting your pattern uses.
- Remove all borders in the whole chart: Click on the "Select" Arrow to enter select mode; then use Control-A to select all cells in the chart. Click the Borders – None button.
- To fill an area very quickly with all purl stitches, or all knit stitches (or any stitch), copy a single instance of that stitch, then select the area to fill. Paste (Control-V), and the area will be filled.
- Does your chart look fuzzy when you paste it into another document? (either via Copy to Clipboard or Export to PNG) Usually this means the other application is making the chart larger than it was originally created. It's best to try and get the font size in Knit Visualizer as close as possible to where you want it for your other document. Otherwise we recommend making the font larger, then sizing the chart down in your other document.
- Switch between Select and Paint mode quickly using the S key. If you're in Paint mode, tap S and you're in Select mode. If you're already in paint mode, tap S and you're in Select mode now. This tip will only work if you are NOT currently typing into the pattern entry field.

Quick Reference: Keyboard Shortcuts

Command	Key Sequence	Description
Application Preferences	Control-,	Shows dialog letting you edit Application wide preferences
Copy	Control-c	Copies current chart selection
Cut	Control-x	Cuts the current selection to the buffer; and replaces it with blank stitches in the chart
Decrease Font	Control--	Zoom out; decreases the font size of the chart
Delete	Delete	Deletes the current selection (not copied to buffer)
Duplicate	Control-d	Only works when selecting Cells or Columns; Duplicates & inserts the selection at the top of chart for rows, and at the right of the chart for columns
Duplicate	Control-d	Duplicates the row or column selection to the top or right side of the chart.
Increase Font	Control-+	Zoom in; increases the font size of the chart
Insert	Control-i	Inserts a full row or column that was previously copied into the buffer
Paste	Control-v	Pastes buffer
Redo	Control-y	Redo the last Undo action
Save	Control-s	Save the current chart. If filename has already been assigned it will save again in the same place.
Undo	Control-z	Reverses the last chart action (Edit, insert, etc)
Paint Continuous	Shift-left click, held down	Paints the same stitch over each cell the mouse is dragged over while both shift and the left mouse button are held down
Show Chart Properties	Control-[Shows the Chart Properties dialog
Border Top	Control-T	Adds border on the top edge of the selection
Border Right	Control-R	Adds border on the right edge of the selection
Border Left	Control-L	Adds border on the left edge of the selection
Border Bottom	Control-B	Adds border on the bottom edge of the selection
Border All	Control-;	Adds border around all edges of the selection
Border None	Control-0	Removes all borders within all cells of the selection
New Chart	Control-N	Opens the New Chart dialog
Open Chart	Control-O	Prompts you to open a file containing a chart
Show Preview	Control-P	Lets the user view the Preview dialog and from there Print or Export to an image file

Print this page for a handy reference!

Where to go for Support

Yahoo group: knit-visualizer-users@yahoo.com

You can join this group by visiting: <http://groups.yahoo.com/group/knit-visualizer-users>

This forum is monitored by The Knit Foundry. Additionally you can send email to support@knitfoundry.com. It might take us a while to get back to you; but we do read all comments and suggestions.

Other Resources

There are a lot of books on knitting charts. First and foremost are the Barbara Walker Treasuries. While not all of these books cover charts, they are a great resource for stitch patterns. Knit Visualizer extensively used the patterns in these books to test and build the Pattern Entry parser.

A Treasury of Knitting Patterns

by Barbara G. Walker

Published by: Schoolhouse Press

ISBN: 0942018168

A Second Treasury of Knitting Patterns

by Barbara G. Walker

Published by: Schoolhouse Press

ISBN: 0942018176

Charted Knitting Designs: A Third Treasury of Knitting Patterns

by Barbara G. Walker

Published by: Schoolhouse Press

ISBN: 0942018184

A Fourth Treasury of Knitting Patterns

by Barbara G. Walker

Published by: Schoolhouse Press

ISBN: 0942018206

Online Resources

Knit Foundry has a tutorial for reading charts and knitting from them.

<http://www.knitfoundry.com/freestuff.html>

Kim Salazar at her *string-or-nothing* blog, wrote an excellent series of tutorials on charts & creating them from patterns. The first tutorial is here: http://string-or-nothing.blog-city.com/charting_101.htm

A lot of what she describes in her tutorials, Knit Visualizer does for you, but it's very useful to understand the concepts.
